Research TODOs

- Menger/Rothberger properties and games results
  - Is there a slick characterization of $F \uparrow_{\text{2-mark}} Cov_{C,F}(X)$ for regular/general spaces?
  - Is $F \uparrow_? Cov_{C,F}(X)$ or $F \uparrow_? Cov_{C,S}(X)$ a hereditary property under closed subsets for any type of limited information? (The Menger property is; is Rothberger?)
  - Investigate Markov strategies for S in $Cov_{C,S}(X)$ or P in $Cov_{P,O}(X)$.
  - $S \uparrow_{\text{2-mark}} Cov_{C,S}(X) \Leftrightarrow S \uparrow_{k\text{-mark}} Cov_{C,S}(X)$?
  - $S \uparrow_{\text{2-mark}} Cov_{C,S}(\omega_1^*)$ or $S \uparrow_{\text{2-mark}} Cov_{C,S}(\omega_1^\dagger)$?
  - $F \uparrow_{k\text{-mark}} Fill^{\subseteq}_{C,F}(\kappa) \Rightarrow F \uparrow_{k\text{-mark}} Cov_{C,F}(\kappa^\dagger)$?
- Filling games
  - Show/disprove $F \uparrow_{\text{3-tact}} Fill^{\subseteq}_{M,N}(J)$ implies $F \uparrow_{\text{3-mark}} Fill^{\subseteq}_{M,N}(J)$.
  - Show/disprove $F \uparrow_{\text{2-mark}} Cov_{C,F}(\kappa^\dagger)$ implies $F \uparrow_{\text{2-mark}} Fill^{\subseteq}_{C,F}(\kappa)$.
- Search for a class of spaces where $K \uparrow_{\text{2-tact}} LF_{K,P}(X)$ characterizes metacompact (aka implies $K \uparrow_{\text{tact}} LF_{K,P}(X)$)
  - Investigate the ladder space suggested by G.
  - Try zero-dimensional.
- Proximity Game
  - Read paper by Bell
